1. Introduction

The SOLAX API provides remote capability calls for Third party. Third party sends HTTPS/HTTP GET or POST requests to the API server to query, modify, and remotely control Solax platform data.

The third party needs to add corresponding parameters in the request message according to the API instructions to call the API. SOLAX platform will return the processing results based on the processing of the request.

2. Operating procedures

1. Log in <https://www.solaxcloud.com/#/login> to register an account
2. Obtain a unique token through the menu [service-API]
3. Call the API according to the *Solax EV Charger API* document

3. HTTP request paradigm

3.1. Interface format and protocol

The API operate the platform data through HTTP protocol, and return the results in JSON format.

Interface address:

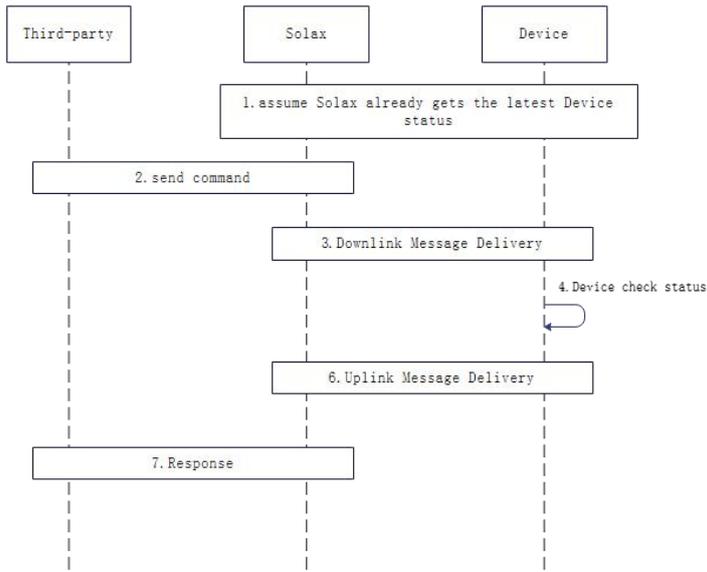

`https://www.solaxcloud.com/proxyApp/proxy/api/<API_VERSION>/<RESOURCE_NAME>/<RESOURCE_ACTION>`

Notice:

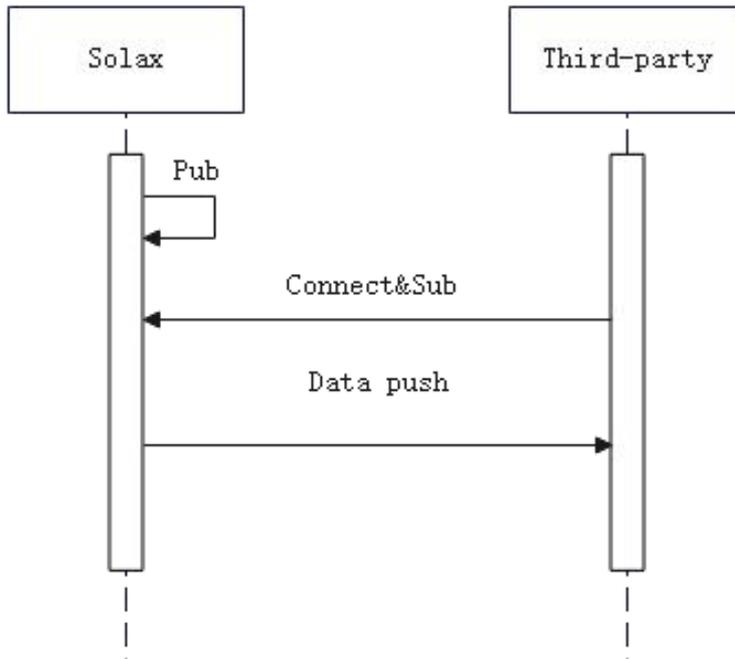

1. API_VERSION: version number, the current version is v2.0.
2. RESOURCE_NAME: the resource to be operated on, such as userMng, agentMng, siteMng and so on.
3. RESOURCE_ACTION: the actions on the resource, such as list, add and so on.

3.2. Sequence Diagram

Get/post request:

DataPush:

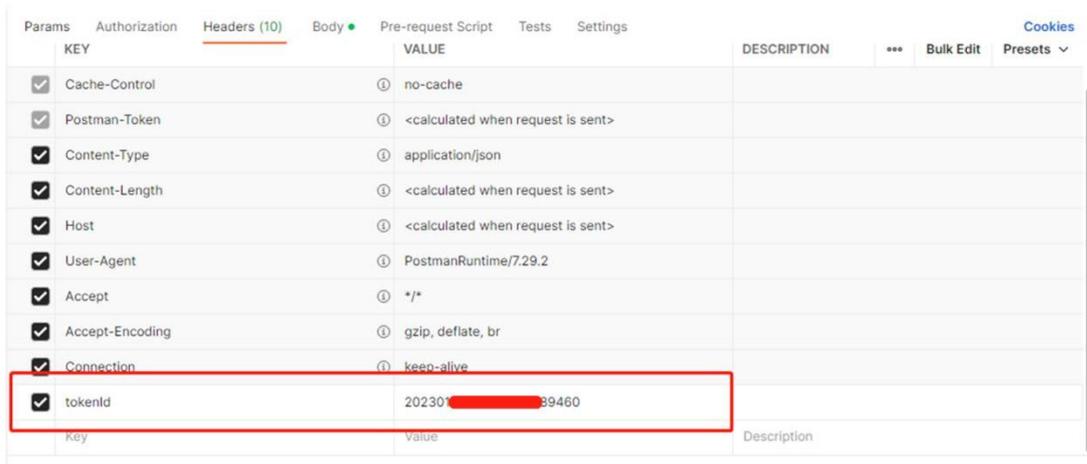

4. Common parameter

4.1. Token

Parameter	Notes
tokenId	Get from [service-API], Please keep the token safe and do not leak it.

Notice: When calling the interface, tokenId needs to be placed in Headers.

When commissioning the interface, the interface testing tool [Postman] can be used to commission and place tokens in headers.

4.2. Common return object

Name	Type	Description
success	Boolean	true=successful, false=unsuccessful
exception	String	Error message
result	Object	Concrete data returned

5. Calling case

If it is successfully called, the interface provided normal feedback results. When a failure occurs, the interface prompts an error message and error code;
